 WITHDIRECTIONS FOR THEIR CULTURE \& MANAGEMENT

## WINTER-BLOOMING PLANTS, ROSES, \&c.

Chioce Plower Seeds for Sowing in the Autumn, and a few of the most desirable varicties of SMAL_ FRUITS FOR GENERAL CULTIVATION.

SOLD BY
HHNRY A. DRHHR, Seedman and Florist,

CHESTNUT STREET, PHILADELPHIA, PA.

## H. A. DREER

Takes pleasure in offering to his numerous friends and patrons, his New Catalogue of BULBOUS ROOTS, for the Autumn of 1865 , which will be formd to cmbrace a list of all the most desirable varieties-ispecial care hrving been taken in their selection, to secure those combining all the essenii il qualities to recommend them, viz: size, color, and free-blooming qualities. The Fyacinths will be found especially descrving of attention, and have been selected from one of the finest collections in Haarlem. They are especially adepted for foreing into early bloom, $i$ ots or glasses.

BULBOUS ROOTS, BY MAIL. No extra charge will be made over Catalogue prices to those ordering an rassortment at the retail prices. When wrdered by the dozen or hundred, it is preferable to send by Eacpress, which will be rit the purchaser's cost.
thi uler's from unknown correspondents must be aceompanied by C.ISH, a sntisfuctory reference, or instruetion to COLEECT ON DELTVERT, by Express.

张 Be particular to write your name distinctly, with Rost-Office, County, rinit State.

Address,

## HEVRY A. DREER,

Philadelphia, Pa.

#  

THEIR NATURE AND TREATMENT.

Bulbs are plants which belong to a particular division of the vegetable kingdom; they are all, with scarcely a single exception, very ornamental, and hence desirable, for the very large size of this flower in proportion to the entire plant, and for the brilliancy of their colors. By far the greater number of bulbs flower in the spring, and produce their flower stems immediately after they begin to grow; and shortly after they have flowered, they cease growing, and remain dormant, and without leaves during the remainder of the year; hence, almost all bulbs require to be planted in the autumn-a fact which most amateurs are apt to overlook, and frequently send their orders out of season. Bulbs require a free, dry and somewhat rich soil, into which the roots may penetrate freely. A bulb is essentially a bud, and contains within itself the germs of the leaves and flowers which are to be produced the following season; thus, in one sense they are of more easy culture than any other class of plants, because the germ being previously formed, and the nourishment being provided in the body of the bulb, it is only necessary to supply heat and moisture to cause them to de-velop-this is fully exemplified in the Hyacinth, Narcissus, Crocus, early Tulips, and some other bulbs, which can be flowered when placed over water, in glasses or in wet moss. The Hyacinth is the especial favorite for forcing in glasses, and full directions for their management will be found under the head of hyacinths.

SOIL—The proper compost for Hyacinths, Tulips, Crown Imperials, Iris, Ranunculus, Anemones, Crocus, and most other bulbs, is the following: one-third sand, one-third well rotted cow manure, and one-third good garden mould.*

The Amaryllis, require a richer loam, and Ixias and Gladiolus a soil rather more sandy than the general average.
TIME OF PLANTING-The preferable season for planting all hardy bulbs, is from October to December; but they can be set out at any late time, as long as the bulbs remain sound.

DEPTH AND DISTANCE-Hyacinth, Amaryllis, Martagon and other large Lillies, and Pæonias, should be planted at the depth of four inches: Crown Imperials and Polyanthus Narcissus, five inches; Tulips, Double Narcissus, Jonquilles and Colchicums, three inches; Bulbous Iris, Crocus, Arums, small Fritillarias, Gladiolus Byzantium and Snowdrops, two inches; Ranunculus and Anemones, one inch, always measuring from the top of bulb. The rows should be about ten inches apart, and the roots to be placed from four to six inches apart in the rows, according to their size.

[^0]TAKING UP AND PRESERVING-Take up Bulbous Roots about a month after the blossom is completely over, in the following manner:-when the plants put on a yellowish decayed appearance, take up the roots, cut off the stem and foliage within an inch of the bulbs, but leave the fibres, \&c. attached to them; spread them in an airy room for two or three weeks to dry, after which wrap each root carefully in paper, (as the air is very injurious to bulbs,) or cover them in sand perfectly dry.

Bulbs intended for blooming in pots during the winter season, should be planted during the months of October and November, and be left exposed to the open air until they begin to freeze, and then be placed in the greenhouse or a room where fire is usually made. They will need moderate occasional watering until they begin to grow, when they should have an abundance of air in mild weather, and plenty of water from the saucers, whilst in a growing state; and should be exposed as much as possible to the sun, air and light, to prevent the leaves from growing too long, or becoming yellow.

## 

## THE TREATMENT OF HYACINTHS IN POTS AND GLASSES.

For the growth of Hyacinths in pots, prepare one half decomposed friable turfy loam, with the remainder, equal parts of well rotted manure, leaf-mould and river-sand, well incorporated together, and should, when so prepared be used in a tolerably dry state (free from adhesiveness), so as to admit of a firm pressure without injury. The most favorable season for planting is September, and onwards. The size of pots is regulated by the space or convenience for placing them; where limited, and a rich massive effect is wished for, those of six or eight inches diameter are recommended, in which three or four bulbs may be placed, but where more convenience is had, a succession of single or double bulbs may be placed, but where more convenience is had, a succession of single or double bulbs in smaller pots may be ad-mitted-two bulbs in each is very effective, and generally preferred; the colors of such may be regulated according to taste. In potting, each bulb should remain one-third above the surface of the soil, and the base of each bulb should rest upon a strata of clean river-sand at about three quarters of an inch lower than the rim of each pot, to admit of a judiciously regulated amount of water during the season of bloom. After potting, place them where intended to remain, upon a dry surface of ashes or sharp gravel, in the rotation of their intended periods of bloom (each later potting plunged beyond the previous ones,) and thus arranged, water the whole well to imbed the bulbs firmly within the soil, allowing them to remain until the bulbs and surfaces are again dry (for one or two days;) then cover the whole over to the depth of three or four inches with half-dried tan or pure leaf-mould, for six or eight weeks, in which position the preparatory root-growth is made, necessary to a vigorous development of their flowerscapes. After the period adverted to, less or more, the first potted bulbs may be taken up, the soil and sediment carefully brushed off, and removed to a gentle hot-bed, or a warm genial greenhouse or room where the bloom will progressively expand, care being taken to screen the leaf-growth made

## 3

in darkness for a few days after being dis-imbedded. When an unusually warm spring requires that the covering of $\tan$ or soil should be removed from the general stock, the various batches, or pottings may be removed to cool pits or frames, east or north aspect (air being admitted early in fine weather, and closed early,) until required for the forcing-house. A short difference of a week or fortnight between the periods of potting will produce a corresponding difference in the periods of bloom.

## METHOD TO BLOOM HYACINTHS AND OTHER BULBS, IN THE WINTER SEASON, IN GLASSES.

For this purpose Single Hyacinths, and such as are designated earliest among the Double, are to be preferred. Single Hyacinths are generally held in less estimation than Double ones ; their colors, however, are more vivid, and their bells, though smaller, are more numerous; some of the sorts are exquisitely beautiful; they are preferable for flowering in winter to most of the Double ones, as they bloom two or three weeks earlier and are very sweet scented.
Hyacinths intended for glasses should be placed in them during October and November, the glasses being previously filled with pure water, so that the bottom of the bulb may just touch the water; then place them for the first three or four weeks in a dark closet, box or cellar, to promote the shooting of the fibres, which should fill the glasses before exposing them to the sun, after which expose them to the light and sun gradually. If kept too light and warm at first, and before there is sufficient fibre, they will rarely flower well. They will blow without any sun, but the colors of the flowers will be inferior. The water should be changed as it becomes impure; draw the roots entirely out of the glasses, rinse off the fibres in clean water, and wash the inside of the glass well. Care should be taken that the water does not freeze, as it would not only burst the glass but cause the fibres to decay. Whether the water is hard or soft, is not a matter of much consequence-soft is preferable-but must be perfectly clear, to show the fibres to advantage.

## DOUBLE HYACINTHS. RED AND PINK.

Louis d'Or, bright yellow; early,and fine bells.30
Melistoke, orange ..... 25
Ophir d'Or, bright yellow; veryfine, late, not suitable for forcing25

## SINGLE HYACINTHS.

Single Hyacinths are, by some, held in less estimation than double ones; but, on a closer acquaintance with their fine qualities, they will be found more deserving of cultivation. They are desirable for their early flowering, espeeially in pots or glasses; their colors are more brilliant, and they excel the Double in their greater profusion of bells and fine odor.

RED AND PINK. Each. Aemilius, rose: early and fine..... 25

## HYACINTHS IN PACKAGES.

The following are put up in packages of six roots each, with names and colors marked, and are sold at lower prices than the same quality of roots can be when selected from the Catalogue. They are all free blooming, choice varieties. Nos. 1 and 2 are double, 3 and 4 single, 5 half double and half single.
Also, packages of six roots each, with colors marked, but are not named. No. 6, double; No. 7, single; No. 8, half double and half single.

No. 1.- $\$ 1.25$ per package. contaiss:
Grossfurst, pink; Panorama, red; King of the Netherlands, dark blue; Roi Josaphat, porcelain blue ; La Virginite, pure white; Pereander, white, with purple eye.

No. 2.- $\$ 1.50$ per package. contains:
Bouquet Tendre, crimson; Czar Nicholas, light rose; Envoye, light blue; Lord Wellington, dark blue; Anna Maria, white, with red eye; Virgo, pure white.

No. 3.- $\$ 1.25$ per package.
contains:

Cassandra, dark rose; L'Amie du Coeur, crimson; Emicus, deep blue, with white eye; Iris, porcelain blue; Comtesse de Teylingen, white; Prince Royal, pure white.

## No. 4.- $\$ 1.50$ per package. <br> contains:

Belle Eleonore, dark red; La Baleine, pink; Charles Dickens, blue; Prince of Saxe Weimer, dark blue; Grand Vainqueur, pure white; Voltaire, rosy white.

## Ghbe Eutip.

Nothing can exceed in brilliancy of colors, a bed of Tulips. Any good garden soil will answer; but a soil as already recommended for Hyacinths, will also bloom the Tulip finely. Plant in October or November.

## PARROT TULIPS,

With fringed edges, most brilliant crimson and yellow, with shades of bright green. Unique.

## EARLY SINGLE TULIPS.

These are well known ornaments of the garden as well as the Green-house. Forced in pots, they are very gay and fine: and for bedding in mixtures, or in separate colors and sorts, no spring flower is equal to them in brilliancy.

## (Ghe ©

As one of the earliest ornaments of the flower-garden, is a universal favorite, being neat, dwarf, and compact in growth, and varied in all the essential shades of color for producing harmony of effect, either separately or blended together. The principal adaption of this bulb consists in its suitability for planting sufficiently near to the margin or edge of flower-borders, beds, \&c., as not to require removal, or in forming lines or edges entirely of such, in their relative colors, which, after blooming, may be removed as the leaves show maturity of growth by fading in color (the bulbs being stored away dry and cool until the following autumn,) and the same spaces being again occupied by summer flowering plants.
The principal months for planting are October, November, and December, in ordinary rich garden soil, placing the bulbs about two inches deep, and four to six inches from the margin or edge, each group of six to eight or more bulbs being planted in its own relative color, or otherwise in blended varieties, as taste may prefer. These all improve in beauty for some years if not disturbed.
To secure a succession of blooms in pots, commence early in the first-named month with six or eight bulbs in each well-drained pot, using the same rich soil about an inch deep, and, thus planted, place the pots upon a surface of ashes,
covering them over one inch deep with soil, tan, dry leaf-mould, or sand, until the leaves appear through the soil, when they may be removed to the house.

## RANUNCULUS.

For symmetry of form and brilliancy of color, in almost all the varieties and hues which are recognized amongst flowers, the Ranunculus is probably unequalled by any other; for its culture it requires a good depth of rich garden soil. The bulbs are rather tender, and when planted out of doors, the beds must be covered with a heavy layer of tan or leaves, as a protection from frost; they can be grown in pots, and forced into early bloom in the greenhouse.

75 cents per dozen.

Decorator, fine scarlet.

## VERBENA SEED.

To keep a healthy stock of this very desirable bedding plant, it has become necessary to raise them from seed. I offer this season a limited stock of very superior seed, raised from the most choice varieties. Very good, 25 cents per paper. Extra A No. 1, from the best named varieties, 50 cents per paper.

## GLADIOLUS SEED.

This superb class of plants can be readily grown from seed, and I have now (September,) some seedlings in bloom, (the seed of which was not sown before the 1st of October last,) which surpass many of the old favorite varieties. Full directions how to propagate from seed, will accompany each packet: this seed is saved from the choicest named varieties. Price, 50 cents per packet.

## DREER'S PREMIUM PANSY SEED. (Viola Tricolor Maxima.)

To insure fine large blooms, it is necessary to sow in the autumn. Full directions will accompany each packet of seed. Price, 50 cents per packet.

The following varieties of FLOWER SEEDS are recommended for sowing in the autumn, for winter and early spring flowering:

## GOLDEN DWARF PEACH.

We offer to the lovers of the beautiful and the luscious a few hundred well grown trees of Van Buren's Golden Dwarf Peach. As an ornamental tree there is nothing of its size more beautiful. It is prodigiously prolific, and in quality of fruit it has few if any superiors. The fruit is very ornamental being above medium size, of a golden yellow color, with a rich mottled carmine cheek. The leaves add much to its beauty, being very large, closely set, of a deep green color, and hang on much longer than other Peach leaves. The tree is not subject to the diseases that other Peach trees are. It seldom attains a growth of more than three feet in height, the original being but 28 inches in height when four years old. The buds are so close together that one of those little trees loaded with fruit would almost remind the beholder of an immense bunch of very large grapes.

This is the only Peach tree that will remain a dwarf when planted where the roots have a chance to spread. Price, $\$ 1.00$ each.

## 15

## SUMMER FLOWERING BULBS,

## For Planting in the Spring.

BULBS READY FOR DELIVERY IN OCTOBER.

## The most prominent in this section are the rare and beautiful

## FRENCH HYBRID GLADIOLUS.

They are the most stately and effective of the whole genus; being of a robust erect growth, with green sword-shaped leaves and magnificent flower scapes, rising from three to five feet in height. The colors comprise the most brilliant of orange, scarlet and vermillion tints upon yellow and orange grounds, including a graduated scale of intermediate shades, from white with rosy blush and salmon rose tints, to a salmon-red and nankeen; from blush-white with purple crimson throat, and marginal streaks of pink, to light rosy salmon grounds, with flakes of deep carmine. A succession of bloom may be had from July to September, by planting at intervals from April to June, reserving the strongest bulbs for the latest planting. Their culture is very simple; they will grow in any ordinary garden-mould, but succeed best in good earth, manured with well-rotted horse-dung. The bulbs are taken up in the fall and placed in a dry cellar, protected from frost.

Adonis, light rosy salmon, carmine margin salmon, car mine margin.

30
Aglæ, bright shaded salmon, large 25
Amabilis, vermillion, scarlet....
Aristote, light rose, purplish crimson stripes.15
